## Certification tests

Certification tests (LV-CERT) for initial certification/recertification are offered a number of times every year. Dates for the basic course and certification tests can be found on our home page at:

[www.siemens.de/sitrain-zertifizierung-3wl](http://www.siemens.de/sitrain-zertifizierung-3wl)

The test consists of a theory component and an extensive practical component (circuit breaker installation and available testing methods). The theory component comprises 25 questions from the field of low-voltage circuit breakers. Participants have 45 minutes to answer these questions.

The tests are generally to be completed working alone and without external aids. Participants completing a test in a language other than their native tongue may use a dictionary and are allowed an extra 15 minutes.

The practical component of the test, which is based on the 3WL11 circuit breaker, is completed in groups of two. There are four tasks to be performed. A period of 120 minutes is allowed for this component.

## Recertification

All certificates are valid for four years. Expiring certificates can be extended for an additional four years by completing a recertification test.

Recertification tests are the same as the ordinary certification tests and the testing arrangements are just as for initial certification.
